Rebar (short for reinforcing bar), known when massed as reinforcing steel or reinforcement steel, is a steel bar or mesh of steel wires used as a tension device in reinforced concrete and reinforced masonry structures to strengthen and aid the concrete under tension. Concrete is strong under compression, but has weak tensile strength. Rebar significantly increases the tensile strength of the ...

Rebar - Wikipedia

Consider a slab supporting a point load (Figure 2). If the \tilde{r} radius of relative stiffness \tilde{r} defines the area supporting the load, then if $l = 700\text{mm}$, the area is $S \approx 0.70\text{m}^2 = 1.54\text{m}^2$. If a joint is cut 150mm from the load, then 0.98m^2 of load-

Concrete, usually Portland cement concrete, is a composite material composed of fine and coarse aggregate bonded together with a fluid cement (cement paste) that hardens over time—most frequently a lime-based cement binder, such as Portland cement, but sometimes with other hydraulic cements, such as a calcium aluminate cement. It is distinguished from other, non-cementitious types of concrete ...
